

Medical Insurance Cost Prediction using Linear Regression

Project Documentation — Presented by Shafaat

Problem Statement

The Challenge

Medical insurance costs vary widely — hard to estimate without a data-driven approach

The Goal

Predict insurance charges based on demographic and health-related features

The Solution

Build a supervised Machine Learning model using Linear Regression

Objectives

Explore & Preprocess

Explore and preprocess the medical insurance dataset

Build & Train

Build and train a Linear Regression model

Evaluate Performance

Evaluate model performance using standard regression metrics

Establish Baseline

Use the model as a reliable baseline for insurance cost prediction

Dataset Overview

Patieeyt Pating Redol					
OII	Wap: Sunarce	Patientl	To T	Pat T	Patiend
\$956	Ratenu	Sotie 76l	118,90	A8l Ean 7inw	\$38-\$ace
	\$190	\$126-\$,950	\$6,90	\$8,0	Saeew
\$2,3	\$30	187	18,86	\$5,86	\$,66-\$3,91
4242	\$50	131	13,80	\$3,86	\$,89-\$6,90
1731	\$20		\$2,88	\$2,16	\$,63-\$8,70
\$935	\$80	\$70	13,88	\$110	\$,68-\$3,06
\$956	\$50		\$3,18	\$230	\$150-\$5,90

9951	\$20		\$7,80	\$53	\$,86-\$8.557
9994	\$20		\$5,90	\$86	\$,90-\$9,906
9931	\$30		\$2,30	\$44	\$,98-\$8.320

Source

Medical Insurance dataset — a structured, publicly available dataset for regression analysis.

Input Features

- **Age** — policyholder's age
- **Sex** — gender of the insured
- **BMI** — body mass index
- **Children** — number of dependents
- **Smoker** — smoking status
- **Region** — geographic region

Target Variable

Charges — insurance cost in USD

Data Preprocessing

Each step was carefully applied to ensure data quality and model readiness — from cleaning raw records to preparing a balanced train/test split for reliable evaluation.

Model: Linear Regression

How It Works

Linear Regression models the relationship between input features and the target variable (charges) by learning a set of coefficients for each feature.

Optimization

Finds the best-fit line by **minimizing the sum of squared errors** between predicted and actual values.

Why Linear Regression?

Simple, interpretable, and effective for continuous value prediction — making it an ideal baseline model.

Model Evaluation Results

R² Score: 0.8069

Model explains
80.69% of the
variance in insurance
charges — strong
predictive fit

MAE: 4,177.05

Average absolute
prediction error in
USD

RMSE: 5,956.34

Standard deviation of prediction errors — penalizes
larger deviations

Conclusion & Future Work

Key Takeaway

The Linear Regression model achieved **strong predictive performance** with an R^2 of 80.69%, establishing a solid baseline for medical insurance cost estimation.

Future Improvements

- Explore **Random Forest** and **XGBoost** for higher accuracy
- Apply feature engineering to capture non-linear relationships
- Expand dataset for better generalization across populations
